

## Tip: How to setup CLPPlus on Windows

### Target audience

Those who have difficulties to start CLPPlus on Windows.

### Introduction

Working with Db2 on Windows I wanted to use CLPPlus rather than CLP. But when I entered "clpplus", nothing happened, I just got a new prompt. Apparently, when you install Db2 on Windows, the setup for CLPPlus is not complete. This tip explains the **setup** for CLPPlus on Windows.

### The setup

1. When you type "clpplus", the program clpplus.bat is to be invoked.  
This file resides in  
C:\Program Files\IBM\SQLLIB\BIN (assuming your Db2 is installed on C: )  
Make sure the PATH environment variable includes this directory.
2. Make sure the CLASSPATH environment variable contains  
C:\Program Files\IBM\SQLLIB\TOOLS\clpplus.jar  
C:\Program Files\IBM\SQLLIB\TOOLS\jline-0.9.93.jar
3. Make sure there is a system environment variable JAVA\_HOME  
storing a directory that contains Java,  
e.g., the following two entries:  
C:\Program Files\IBM\SQLLIB\java  
C:\Program Files\IBM\SQLLIB\java\jdk\jre\bin
